

The main tasks for 13/08/2026 Lecture of CSC360 was installation and verification of required tools for the course including java, maven, ssh, github repos.
I created my first project using maven and the terminal itself.
Inside that i created my first graphical file and made a simple square with a fill outline.
I coded it in a simple .txt file and executed it using my terminal and a maven java project.
I used the swing library for the same.
Here's the output.

And here's the code for the same.

```
package com.example;

import javax.swing.*.*;
import java.awt.*.*;

public class SquareApp {

    public static void main(String[] args) {

        JFrame frame = new JFrame("Square Example");

        frame.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);

        frame.setSize(400, 400);

        frame.add(new SquarePanel());

        frame.setVisible(true);
```

```
}  
  
}  
  
class SquarePanel extends JPanel {  
  
    @Override  
  
    protected void paintComponent(Graphics g) {  
  
        super.paintComponent(g);  
  
        g.setColor(Color.BLUE);  
  
        // x, y, width, height — width == height makes it a square  
  
        g.drawRect(100, 100, 150, 150);  
  
    }  
  
}
```

Here JFrame functions are used to set dimensions and open the frame itself inside which square is set and inside the frame, functions of drawrect and paint are used to define the square itself.
